# Regression Models - Course Project

Pier Lorenzo Paracchini, 18.12.2015

# **Executive Summary**

According to the selected linear regression model **automatic** models are better for mpg. Actually **automatic** models have an estimated mpg of 26.585 (miles per gallon) with a 95% confidence interval included in [23.67 - 29.5] while **manual** models have an increased estimated mpg of 5.277 (miles per gallon).

## Data Analysis

The mtcars dataset include 32 observations of 11 features. Each onservations comprises some information for a specific automobiles (1973 - 1974 model). The focus of this investigation is two specific features mpg (miles per gallon) and am (type of transmission - 0: automatic, 1: manual).

The available datase contains 19 automatic car models and 13 manual car models. The observed mpg by type of transmission am can be seen in the provided hystogram (see **Appendix**, **Figure 1**).

From the hystogram we can see that am (predictor) is visibly related to mpg (outcome) as we can see from the sample mean of each group. The "automatic" group has a lower sample mean (17.147 Miles/Gallon) than the "manual" group (24.392 Miles/Gallon).

# Regression Model

### A Simple Model

The simpler linear model, we can build, uses mpg (as outcome) with am as predictor  $(mpg \sim am)$ . The coefficients of the fitted model are

```
## Estimate Std. Error t value Pr(>|t|)
## (Intercept) 17.147368 1.124603 15.247492 1.133983e-15
## am1 7.244939 1.764422 4.106127 2.850207e-04
```

From the Residual vs Fitted plot (see **Appendix**, **Figure 2**) we can see that the model is just able to predict two possible values for the estimated mpg based on the predictor - 17.147 mpg for automatic models and 24.392 mpg for manual models with an estimated residuals standard error of 4.902 mpg. While the Q-Q plot (see **Appendix**, **Figure 2**) confirms the normality of the errors (assumption). A more detailed interpration of the simple model can be found in **Appendix**, **Simple Model Interpretation**.

### Extending the Model adding new features

The simple model is quite limited. Looking at the available features, other possible features could be used to identify a "better" model. A possible feature that may be valuable investigating is hp (gross horse power in hp). The relationship between mpg vs. hp by am can be seen in Appendix, Figure 3.

Using the **nested model testing technique** for the following nested models we can see that, **added** feature of model 2 are necessary over model 1 (P-value < 0.05).

```
## Analysis of Variance Table
##
## Model 1: mpg ~ am
## Model 2: mpg ~ am + hp
## Res.Df RSS Df Sum of Sq F Pr(>F)
## 1 30 720.90
## 2 29 245.44 1 475.46 56.178 2.92e-08 ***
## ---
## Signif. codes: 0 '***' 0.001 '**' 0.05 '.' 0.1 ' ' 1
```

Model 2 (mpg ~ am + hp) seems to provide a better "description" of the response and it will be used to answer the original questions. See the Residual vs Fitted plot and Q-Q plot (see Appendix, Figure 4).

**Note!!** The same process can be executed adding other features to the model in a nested fashion - investigating the overall effect of the new features on the model in an incremental way.

#### Findings & Interpretation

Model 2 (mpg ~ am + hp) has the following coefficients

```
## Estimate Std. Error t value Pr(>|t|)
## (Intercept) 26.5849137 1.425094292 18.654845 1.073954e-17
## am1 5.2770853 1.079540576 4.888270 3.460318e-05
## hp -0.0588878 0.007856745 -7.495191 2.920375e-08
```

- automatic models (reference group am = 0) have an estimated mpg of 26.585 (miles per gallon) with a standard error of 1.425 (miles per gallon).
- manual models (am = 1) have an increased estimated mpg of 5.277 (miles per gallon) (over the reference group) with a standard error of 1.08 (miles per gallon). The P-value of 0 is statistically significant, reject the null hypothersis (having an increase/ decrease over the reference group null).

According to this very simple linear model, **automatic** transmission is better for **mpg** than **manual** transmission.

Based on the linear model previously created we can state that

- automatic models use an estimated mpg of 26.585 (miles per gallon) with a 95% confidence interval included in [23.67 29.5] miles per gallon.
- manual models use an increased estimated mpg of 5.277 (miles per gallon) over the reference group with a 95% confidence interval included in [3.069 7.485] miles per gallon.

# Appendix

### Figure 1: Hystogram of observed mpg by am (type of transmission)

Note the *blue* line represent the sample mean for each of the type of transmission (0: automatic, 1: manual).

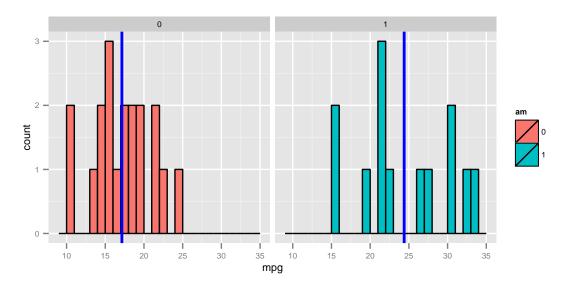

Figure 2: Residual Plots for (mpg ~ am) model

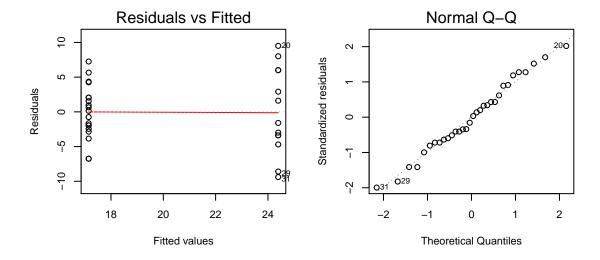

Figure 3: (mpg vs. hp) by am (transmission type) plots

For each type of transmission the **unadjusted** line (black), **adjusted** lines (lightblue for automatic, salmon for manual) and sample averages (horizontal) lines (lightblue for automatic, salmon for manual) are plot.

#### mpg vs. hp - adjusted by am

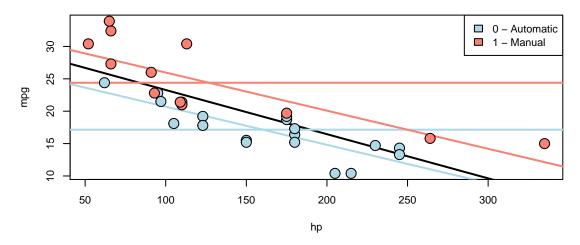

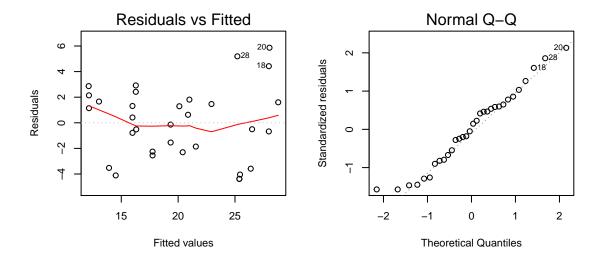

Figure 4: Residual Plots for (mpg ~ am + hp) model

### Simple Model Interpretation

Looking at the coefficients of the simple model (mpg ~ am)

```
## Estimate Std. Error t value Pr(>|t|)
## (Intercept) 17.147368 1.124603 15.247492 1.133983e-15
## am1 7.244939 1.764422 4.106127 2.850207e-04
```

• automatic models (reference group) have an estimated mpg of 17.147 (miles per gallon) with a standard error of 1.125 (miles per gallon).

• manual models have an increased estimated mpg of 7.245 (miles per gallon) (over the reference group) with a standard error of 1.764 (miles per gallon). The P-value of 0 (statistically significant) confirms that the null hypothersis (having an increase/ decrease over the reference group null) can be rejected.

Based on the linear model previosly created we can state that

- automatic models use an estimated mpg of 17.147 (miles per gallon) with a 95% confidence interval included in [14.851 19.444] miles per gallon.
- manual models use an increased estimated mpg of 7.245 (miles per gallon) over the reference group with a 95% confidence interval included in [3.642 10.848] miles per gallon.
